

6 - 7 March 2017 - GRK Workshop Hannover

Lavinia Heisenberg (ETH Zürich)
Fundamental Fields of Gravity

Abstract

After reviewing the fundamental properties of a massless spin-2 field, which is the building block of General Relativity, I will discuss modifications of gravitational interactions based on massive spin-2 fields and scalar fields. Learned from these lessons, I will then discuss how one can construct consistent vector-tensor theories based on a massive spin-1 field. I will also mention the cosmological implications of these modifications.
